

# Objectives

After completing this learning module, you will be able to:

- Explain how the premium of a quotation in New Business can be calculated without the need to have master data objects such as Business Partner, Insurable Objects, or Commission Contracts previously stored on the database by using the remote-enable function module (RFM) **/PM0/ABT\_SVC\_NBQUOTE\_CALCULATE**
- Outline in which business scenario this new RFM can be used
- Describe the interface details of the new RFM
- Understand the extensibility options provided

Management Summary

# Overview

# Overview

As of SAP S/4HANA 1909, the new remote-enabled function module (RFM) **/PM0/ABT\_SVC\_NBQUOTE\_CALCULATE** is provided in FS-PM for calculating the premium of a quotation in New Business without the need to have master data objects such as Business Partner, Insurable Objects, or Commission Contracts previously stored on the database.

The RFM has the following features:

- The RFM has importing parameters for all quotation data that can potentially be premium-relevant according to the FS-PM data model, so that the premium for any product in the Property and Casualty (P&C) and Auto lines of business can be calculated.
- The RFM returns the premium information (including premium tax) at contract and coverage level as output.
- Some unwanted rules and components can be deactivated in the context of this RFM:
  - Selected Check and Derive rules for business transactions
  - Selected Check and Derive rules for entities
  - Deactivation of further components, such as correspondence, can be controlled by the BAdI `/PM0/ABP_DEACTIVATOR_BADI`
- Enhancement option (BAdI) is available to add customer-specific data.
