

```
error_page 500 502 503 504 /50x.html;
location = /50x.html {
    root html;
}

location /user/ { #请求路径中凡是以前缀/user/开头的请求，转发到sso系统
    client_max_body_size 300m; #设置最大的请求体大小，解决大文件上传不了的问题
    proxy_connect_timeout 300s; #代理连接超时时间
    proxy_send_timeout 300s; #代理发送数据的超时时间
    proxy_read_timeout 300s; #代理读取数据的超时时间
    proxy_pass http://127.0.0.1:18080; #转发请求
}

location / { #上面未匹配到的在这里处理
    client_max_body_size 300m;
    proxy_connect_timeout 300s;
    proxy_send_timeout 300s;
    proxy_read_timeout 300s;
    proxy_pass http://127.0.0.1:18081; #转发请求到server系统
}
}
```

2.1.3、测试

POST local : http://127.0.0.1 /user/login

HEADERS

Content-Type = application/json

BODY(F9)

高级参数设置

```
1: {
2:   "phone": "17602026868"
3: }
```

Response

200

YApi 新版如何查看 http 请求数据

Warning: 返回参数 data 应当是 object 类型

2.2、搭建server工程

2.2.1、导入依赖

pom.xml文件：

```
<?xml version="1.0" encoding="UTF-8"?>
<project xmlns="http://maven.apache.org/POM/4.0.0"
          xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
          xsi:schemaLocation="http://maven.apache.org/POM/4.0.0
http://maven.apache.org/xsd/maven-4.0.0.xsd">
    <parent>
        <artifactId>my-tanhua</artifactId>
        <groupId>cn.itcast.tanhua</groupId>
        <version>1.0-SNAPSHOT</version>
    </parent>
    <modelVersion>4.0.0</modelVersion>

    <artifactId>my-tanhua-server</artifactId>

    <dependencies>
```

```
<dependency>
    <groupId>cn.itcast.tanhua</groupId>
    <artifactId>my-tanhua-dubbo-interface</artifactId>
    <version>1.0-SNAPSHOT</version>
</dependency>
<dependency>
    <groupId>org.springframework.boot</groupId>
    <artifactId>spring-boot-starter-web</artifactId>
</dependency>
<dependency>
    <groupId>org.springframework.boot</groupId>
    <artifactId>spring-boot-starter-test</artifactId>
    <scope>test</scope>
</dependency>
<dependency>
    <groupId>org.springframework.boot</groupId>
    <artifactId>spring-boot-starter-data-redis</artifactId>
</dependency>
<!--dubbo的springboot支持-->
<dependency>
    <groupId>com.alibaba.boot</groupId>
    <artifactId>dubbo-spring-boot-starter</artifactId>
</dependency>
<!--dubbo框架-->
<dependency>
    <groupId>com.alibaba</groupId>
    <artifactId>dubbo</artifactId>
</dependency>
<!--zk依赖-->
<dependency>
    <groupId>org.apache.zookeeper</groupId>
    <artifactId>zookeeper</artifactId>
</dependency>
<dependency>
    <groupId>com.github.sgroschupf</groupId>
    <artifactId>zkclient</artifactId>
</dependency>
<dependency>
    <groupId>org.apache.commons</groupId>
    <artifactId>commons-lang3</artifactId>
</dependency>
<dependency>
    <groupId>org.apache.commons</groupId>
    <artifactId>commons-collections4</artifactId>
    <version>4.4</version>
</dependency>
<dependency>
    <groupId>com.baomidou</groupId>
    <artifactId>mybatis-plus</artifactId>
```

```

        </dependency>
        <dependency>
            <groupId>com.baomidou</groupId>
            <artifactId>mybatis-plus-boot-starter</artifactId>
        </dependency>
        <dependency>
            <groupId>mysql</groupId>
            <artifactId>mysql-connector-java</artifactId>
        </dependency>
        <dependency>
            <groupId>commons-io</groupId>
            <artifactId>commons-io</artifactId>
            <version>2.6</version>
        </dependency>
        <dependency>
            <groupId>commons-codec</groupId>
            <artifactId>commons-codec</artifactId>
        </dependency>
    </dependencies>
</project>

```

2.2.2、application.properties

```

spring.application.name = itcast-tanhua-server
server.port = 18081

#数据库连接信息
spring.datasource.driver-class-name=com.mysql.jdbc.Driver
spring.datasource.url=jdbc:mysql://192.168.31.81:3306/mytanhua?
useUnicode=true&characterEncoding=utf8&autoReconnect=true&allowMultiQueries=true
&useSSL=false
spring.datasource.username=root
spring.datasource.password=root

# 枚举包扫描
mybatis-plus.type-enums-package=com.tanhua.server.enums
# 表名前缀
mybatis-plus.global-config.db-config.table-prefix=tb_
# id策略为自增长
mybatis-plus.global-config.db-config.id-type=auto

#dubbo注册中心配置
dubbo.application.name = itcast-tanhua-server
dubbo.registry.address = zookeeper://192.168.31.81:2181
dubbo.registry.client = zkclient
dubbo.registry.timeout = 60000
dubbo.consumer.timeout = 60000

```

```
#sso系统服务地址
tanhua.sso.url=http://127.0.0.1
#默认今日佳人推荐用户
tanhua.sso.default.user=2
```

2.2.3、ServerApplication

```
package com.tanhua.server;

import org.mybatis.spring.annotation.MapperScan;
import org.springframework.boot.SpringApplication;
import org.springframework.boot.autoconfigure.SpringBootApplication;

@MapperScan("com.tanhua.server.mapper") //设置mapper接口的扫描包
@SpringBootApplication
public class ServerApplication {

    public static void main(String[] args) {
        SpringApplication.run(ServerApplication.class, args);
    }
}
```

2.3、搭建dubbo工程

my-tanhua-dubbo是dubbo工程的父工程：

```
<?xml version="1.0" encoding="UTF-8"?>
<project xmlns="http://maven.apache.org/POM/4.0.0"
          xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
          xsi:schemaLocation="http://maven.apache.org/POM/4.0.0
http://maven.apache.org/xsd/maven-4.0.0.xsd">
    <parent>
        <artifactId>my-tanhua</artifactId>
        <groupId>cn.itcast.tanhua</groupId>
        <version>1.0-SNAPSHOT</version>
    </parent>
    <modelVersion>4.0.0</modelVersion>

    <artifactId>my-tanhua-dubbo</artifactId>
    <packaging>pom</packaging>
    <modules>
        <module>my-tanhua-dubbo-interface</module>
        <module>my-tanhua-dubbo-service</module>
    </modules>

</project>
```

2.3.1、创建my-tanhua-dubbo-interface工程

该工程中定义了dubbo服务中的interface与实体对象。

```
<?xml version="1.0" encoding="UTF-8"?>
<project xmlns="http://maven.apache.org/POM/4.0.0"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:schemaLocation="http://maven.apache.org/POM/4.0.0
http://maven.apache.org/xsd/maven-4.0.0.xsd">
    <parent>
        <artifactId>my-tanhua-dubbo</artifactId>
        <groupId>cn.itcast.tanhua</groupId>
        <version>1.0-SNAPSHOT</version>
    </parent>
    <modelVersion>4.0.0</modelVersion>

    <artifactId>my-tanhua-dubbo-interface</artifactId>
    <dependencies>
        <dependency>
            <groupId>org.projectlombok</groupId>
            <artifactId>lombok</artifactId>
        </dependency>
        <dependency>
            <groupId>org.springframework.boot</groupId>
            <artifactId>spring-boot-starter-data-mongodb</artifactId>
        </dependency>
    </dependencies>
</project>
```

2.3.2、创建my-tanhua-dubbo-service工程

```
<?xml version="1.0" encoding="UTF-8"?>
<project xmlns="http://maven.apache.org/POM/4.0.0"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:schemaLocation="http://maven.apache.org/POM/4.0.0
http://maven.apache.org/xsd/maven-4.0.0.xsd">
    <parent>
        <artifactId>my-tanhua-dubbo</artifactId>
        <groupId>cn.itcast.tanhua</groupId>
        <version>1.0-SNAPSHOT</version>
    </parent>
    <modelVersion>4.0.0</modelVersion>

    <artifactId>my-tanhua-dubbo-service</artifactId>

    <dependencies>
        <!--引入interface依赖-->
```

```
<dependency>
    <groupId>cn.itcast.tanhua</groupId>
    <artifactId>my-tanhua-dubbo-interface</artifactId>
    <version>1.0-SNAPSHOT</version>
</dependency>

<dependency>
    <groupId>org.springframework.boot</groupId>
    <artifactId>spring-boot-starter</artifactId>
</dependency>
<dependency>
    <groupId>org.springframework.boot</groupId>
    <artifactId>spring-boot-starter-test</artifactId>
    <scope>test</scope>
</dependency>

<!--dubbo的springboot支持-->
<dependency>
    <groupId>com.alibaba.boot</groupId>
    <artifactId>dubbo-spring-boot-starter</artifactId>
</dependency>
<!--dubbo框架-->
<dependency>
    <groupId>com.alibaba</groupId>
    <artifactId>dubbo</artifactId>
</dependency>
<!--zk依赖-->
<dependency>
    <groupId>org.apache.zookeeper</groupId>
    <artifactId>zookeeper</artifactId>
</dependency>
<dependency>
    <groupId>com.github.sgroschupf</groupId>
    <artifactId>zkclient</artifactId>
</dependency>

<!--MongoDB相关依赖-->
<dependency>
    <groupId>org.springframework.boot</groupId>
    <artifactId>spring-boot-starter-data-mongodb</artifactId>
</dependency>
<dependency>
    <groupId>org.mongodb</groupId>
    <artifactId>mongodb-driver-sync</artifactId>
</dependency>

<!--其他工具包依赖-->
<dependency>
    <groupId>org.apache.commons</groupId>
```

```

        <artifactId>commons-lang3</artifactId>
    </dependency>
    <dependency>
        <groupId>joda-time</groupId>
        <artifactId>joda-time</artifactId>
    </dependency>

    <dependency>
        <groupId>io.netty</groupId>
        <artifactId>netty-all</artifactId>
    </dependency>

</dependencies>

</project>

```

application.properties:

```

# Spring boot application
spring.application.name = itcast-tanhua-dubbo-service

# dubbo 扫描包配置
dubbo.scan.basePackages = com.tanhua.dubbo.server
dubbo.application.name = dubbo-provider-tanhua

#dubbo 对外暴露的端口信息
dubbo.protocol.name = dubbo
dubbo.protocol.port = 20880

#dubbo注册中心的配置
dubbo.registry.address = zookeeper://192.168.31.81:2181
dubbo.registry.client = zkclient
dubbo.registry.timeout = 60000

#springboot MongoDB配置
spring.data.mongodb.username=tanhua
spring.data.mongodb.password=l3SCjl0HvmSkTtiSbN0Swv40spYnHhDV
spring.data.mongodb.authentication-database=admin
spring.data.mongodb.database=tanhua
spring.data.mongodb.port=27017
spring.data.mongodb.host=192.168.31.81

```

编写启动类：

```
package com.tanhua.dubbo.server;

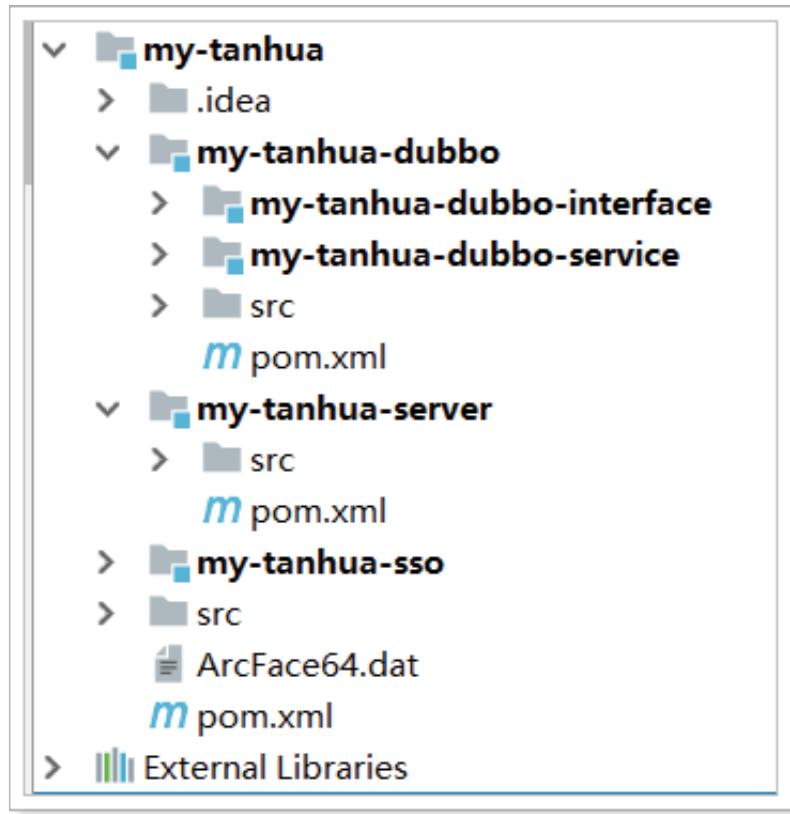

import org.springframework.boot.SpringApplication;
import org.springframework.boot.autoconfigure.SpringBootApplication;

@SpringBootApplication
public class DubboApplication {

    public static void main(String[] args) {
        SpringApplication.run(DubboApplication.class, args);
    }
}
```

2.4、工程结构

最终搭建完成的效果如下：

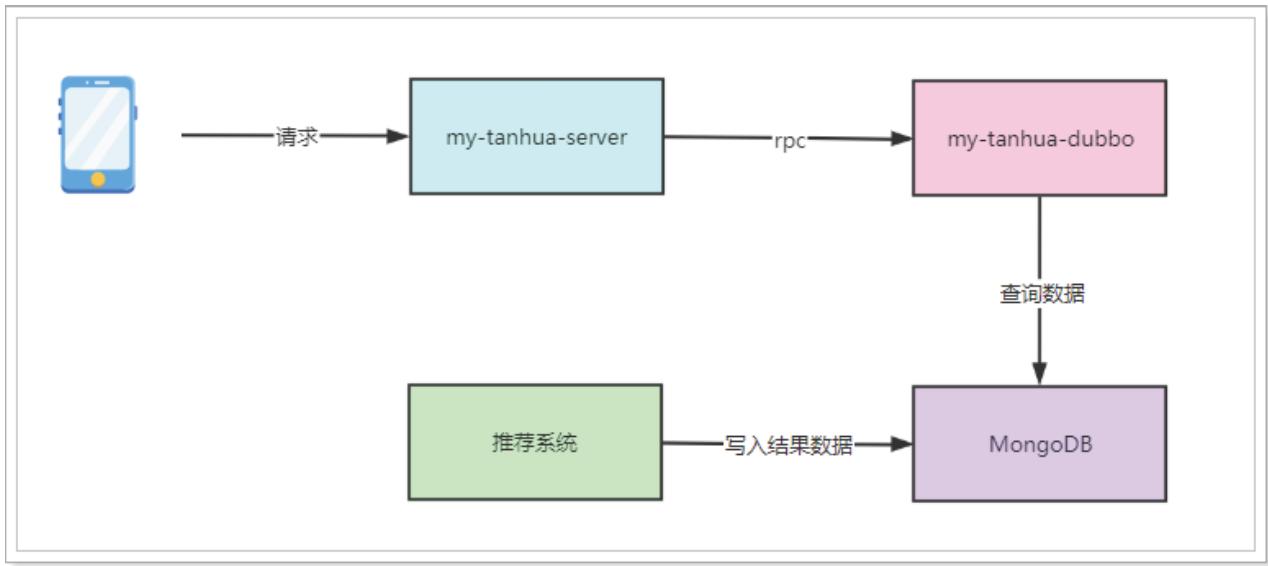

3、今日佳人

今日佳人，会推荐缘分值最大的用户，进行展现出来。缘分值的计算是由用户的行为进行打分，如：点击、点赞、评论、学历、婚姻状态等信息组合而成的。

实现：我们先不考虑推荐的逻辑，假设现在已经有推荐的结果，我们只需要从结果中查询到缘分值最高的用户就可以了。至于推荐的逻辑以及实现，我们将后面的课程中讲解。

流程：

3.1、表结构

```
#表结构, 表名: recommend_user
{
    "userId":1001,  #推荐的用户id
    "toUserId":1002, #用户id
    "score":90,     #推荐得分
    "date":"2019/1/1" #日期
}
```

已经提供的测试数据（4855条数据）：

_id	userId	toUserId	score	date
5fae8cad590801000	66	1	99.96	2020/11/13
5fae8cad590801000	99	1	96.79	2020/11/13
5fae8cad590801000	87	1	96.78	2020/11/13
5fae8cad590801000	59	1	96.76	2020/11/13
5fae8cad590801000	21	1	92.49	2020/11/13
5fae8cad590801000	69	1	92.49	2020/11/13
5fae8cad590801000	2	1	92.48	2020/11/13
5fae8cad590801000	93	1	92.47	2020/11/13
5fae8cad590801000	48	1	91.54	2020/11/13
5fae8cad590801000	41	1	91.54	2020/11/13
5fae8cad590801000	64	1	91.53	2020/11/13
5fae8cad590801000	24	1	91.16	2020/11/13
5fae8cad590801000	35	1	91.16	2020/11/13
5fae8cad590801000	63	1	91.15	2020/11/13
5fae8cad590801000	26	1	91.13	2020/11/13
5fae8cad590801000	4	1	90.78	2020/11/13
5fae8cad590801000	16	1	90.77	2020/11/13
5fae8cad590801000	86	1	90.77	2020/11/13
5fae8cad590801000	88	1	90.76	2020/11/13
5fae8cad590801000	89	1	90.76	2020/11/13
5fae8cad590801000	8	1	90.42	2020/11/13
5fae8cad590801000	36	1	90.41	2020/11/13
5fae8cad590801000	52	1	90.4	2020/11/13

3.2、编写dubbo服务

3.2.1、编写接口

在my-tanhua-dubbo-interface工程中定义接口：

```

package com.tanhua.dubbo.server.api;

import com.tanhua.dubbo.server.vo.PageInfo;
import com.tanhua.dubbo.server.pojo.RecommendUser;

public interface RecommendUserApi {
    /**
     * 查询一位得分最高的推荐用户
  
```

```
*  
* @param userId  
* @return  
*/  
RecommendUser queryWithMaxScore(Long userId);  
  
/**  
 * 按照得分倒序  
*  
* @param userId  
* @param pageNum  
* @param pageSize  
* @return  
*/  
PageInfo<RecommendUser> queryPageInfo(Long userId, Integer pageNum, Integer  
pageSize);  
}
```

```
package com.tanhua.dubbo.server.pojo;  
  
import lombok.AllArgsConstructor;  
import lombok.Data;  
import lombok.NoArgsConstructor;  
import org.bson.types.ObjectId;  
import org.springframework.data.annotation.Id;  
import org.springframework.data.mongodb.core.index.Indexed;  
import org.springframework.data.mongodb.core.mapping.Document;  
  
@Data  
@NoArgsConstructor  
@AllArgsConstructor  
@Document(collection = "recommend_user")  
public class RecommendUser implements java.io.Serializable{  
  
    private static final long serialVersionUID = -4296017160071130962L;  
  
    @Id  
    private ObjectId id; //主键id  
    @Indexed  
    private Long userId; //推荐的用户id  
    private Long toUserId; //用户id  
    @Indexed  
    private Double score; //推荐得分  
    private String date; //日期  
}
```

```

package com.tanhua.dubbo.server.vo;

import lombok.AllArgsConstructor;
import lombok.Data;

import java.util.Collections;
import java.util.List;

@Data
@AllArgsConstructor
public class PageInfo<T> implements java.io.Serializable {

    private static final long serialVersionUID = -2105385689859184204L;

    /**
     * 总条数
     */
    private Integer total = 0;

    /**
     * 当前页
     */
    private Integer pageNum = 0;

    /**
     * 一页显示的大小
     */
    private Integer pageSize = 0;

    /**
     * 数据列表
     */
    private List<T> records = Collections.emptyList();

}

```

3.2.2、编写实现

```

package com.tanhua.dubbo.server.api;

import com.alibaba.dubbo.config.annotation.Service;
import com.tanhua.dubbo.server.pojo.RecommendUser;
import com.tanhua.dubbo.server.vo.PageInfo;
import org.springframework.beans.factory.annotation.Autowired;
import org.springframework.data.domain.PageRequest;
import org.springframework.data.domain.Sort;
import org.springframework.data.mongodb.core.MongoTemplate;

```

```

import org.springframework.data.mongodb.core.query.Criteria;
import org.springframework.data.mongodb.core.query.Query;

import java.util.List;

@Service(version = "1.0.0") //申明这是一个dubbo服务
public class RecommendUserApiImpl implements RecommendUserApi {

    @Autowired
    private MongoTemplate mongoTemplate;

    @Override
    public RecommendUser queryWithMaxScore(Long userId) {
        //查询得分最高的用户，按照得分倒序排序
        Query query = Query.query(Criteria.where("toUserId").is(userId))
            .with(Sort.by(Sort.Order.desc("score"))).limit(1);
        return this.mongoTemplate.findOne(query, RecommendUser.class);
    }

    @Override
    public PageInfo<RecommendUser> queryPageInfo(Long userId, Integer pageNum,
    Integer pageSize) {

        //分页并且排序参数
        PageRequest pageRequest = PageRequest.of(pageNum - 1, pageSize,
        Sort.by(Sort.Order.desc("score")));

        //查询参数
        Query query =
        Query.query(Criteria.where("toUserId").is(userId)).with(pageRequest);

        List<RecommendUser> recommendUserList = this.mongoTemplate.find(query,
        RecommendUser.class);

        //暂时不提供数据总数
        return new PageInfo<>(0, pageNum, pageSize, recommendUserList);
    }
}

```

3.2.3、测试

```

package com.tanhua.dubbo.server.api;

import org.junit.Test;
import org.junit.runner.RunWith;
import org.springframework.beans.factory.annotation.Autowired;
import org.springframework.boot.test.context.SpringBootTest;

```

```
import org.springframework.test.context.junit4.SpringRunner;

@RunWith(SpringRunner.class)
@SpringBootTest
public class TestRecommendUserApi {

    @Autowired
    private RecommendUserApi recommendUserApi;

    @Test
    public void testQueryWithMaxScore() {
        System.out.println(this.recommendUserApi.queryWithMaxScore(1L));
        System.out.println(this.recommendUserApi.queryWithMaxScore(8L));
        System.out.println(this.recommendUserApi.queryWithMaxScore(26L));
    }

    @Test
    public void testQueryPageInfo() {
        System.out.println(this.recommendUserApi.queryPageInfo(1L, 1, 5));
        System.out.println(this.recommendUserApi.queryPageInfo(1L, 2, 5));
        System.out.println(this.recommendUserApi.queryPageInfo(1L, 3, 5));
    }
}
```

3.3、实现今日佳人服务

3.3.1、mock服务

地址：<https://mock-java.itheima.net/project/35/interface/api/617>

基本信息

接口名称：今日佳人

创建人： admin

状态：● 已完成

更新时间：2020-10-16 09:24:28

接口路径： /tanhua/todayBest

Mock地址：<https://mock-java.itheima.net/mock/35/tanhua/todayBest>

请求参数

Headers :

参数名称	参数值	是否必须	示例	备注
Content-Type	application/json	是		
Authorization	eyJ0eXAiOiJKV1QiLCJhbGciOiJIUzI1NiJ9.eyJleHAiOiE1NjI4MjkzMzYsInVzZXJfaWQiOiIxIn0.Mbzn6LzsLrkVWEbhhexR3lTYDZjxqlcqW11rJxDQ6Ewk	是		令牌

返回数据

名称	类型	是否必须	默认值	备注	其他信息
id	integer	必须		编号	最大值: 10000 最小值: 1
avatar	string	必须		头像	枚举: assets/images/avatar_1.png,assets/images/avatar_2.png,assets/images/avatar_3.png,assets/images/avatar_4.png
nickname	string	必须		昵称	枚举: 黑马小妹,米朵妹妹,致远哥哥
gender	string	必须		性别 man woman	枚举: man,woman
age	integer	必须		年龄	最大值: 30 最小值: 20
tags	string []	必须		标签	最小数量: 1 元素是否都不同: true 最大数量: 3 item 类型: string
		非必须			枚举: 单身,本科,年龄相仿
fateValue	integer	必须		缘分值	最大值: 100 最小值: 80

3.3.2、基础代码

3.3.2.1、SexEnum

```
package com.tanhua.server.enums;

import com.baomidou.mybatisplus.core.enums.IEnum;

public enum SexEnum implements IEnum<Integer> {
```

```

MAN(1, "男"),
WOMAN(2, "女"),
UNKNOWN(3, "未知");

private int value;
private String desc;

SexEnum(int value, String desc) {
    this.value = value;
    this.desc = desc;
}

@Override
public Integer getValue() {
    return this.value;
}

@Override
public String toString() {
    return this.desc;
}
}

```

3.3.2.2、BasePojo

```

package com.tanhua.server.pojo;

import com.baomidou.mybatisplus.annotation.FieldFill;
import com.baomidou.mybatisplus.annotation.TableField;

import java.util.Date;

public class BasePojo {

    @TableField(fill = FieldFill.INSERT)
    private Date created;
    @TableField(fill = FieldFill.INSERT_UPDATE)
    private Date updated;
}

```

3.3.2.3、User

```
package com.tanhua.server.pojo;

import com.fasterxml.jackson.annotation.JsonIgnore;
import com.fasterxml.jackson.annotation.JsonIgnoreProperties;
import lombok.AllArgsConstructorConstructor;
import lombok.Data;
import lombok.NoArgsConstructor;

@Data
@NoArgsConstructor
@AllArgsConstructor
@JsonIgnoreProperties(ignoreUnknown = true)
public class User extends BasePojo {

    private Long id;
    private String mobile; //手机号

    @JsonIgnore
    private String password; //密码, json序列化时忽略

}
```

3.3.2.4、UserInfo

```
package com.tanhua.server.pojo;

import com.tanhua.server.enums.SexEnum;
import lombok.AllArgsConstructorConstructor;
import lombok.Data;
import lombok.NoArgsConstructor;

@Data
@NoArgsConstructor
@AllArgsConstructor
public class UserInfo extends BasePojo {

    private Long id;
    private Long userId; //用户id
    private String nickName; //昵称
    private String logo; //用户头像
    private String tags; //用户标签: 多个用逗号分隔
    private SexEnum sex; //性别
    private Integer age; //年龄
    private String edu; //学历
    private String city; //城市
```

```
    private String birthday; //生日
    private String coverPic; // 封面图片
    private String industry; //行业
    private String income; //收入
    private String marriage; //婚姻状态

}
```

3.3.3、实现功能

实现描述：

- 需要根据前端定义的结构定义java对象
- 根据sso系统提供的接口查询当前登录用户的信息
- 根据dubbo系统提供的服务进行查询今日佳人数据

3.3.3.1、TodayBest

```
package com.tanhua.server.vo;

import lombok.AllArgsConstructor;
import lombok.Data;
import lombok.NoArgsConstructor;

/**
 * 今日佳人
 */
@Data
@NoArgsConstructor
@AllArgsConstructor
public class TodayBest {

    private Long id;
    private String avatar;
    private String nickname;
    private String gender; //性别 man woman
    private Integer age;
    private String[] tags;
    private Long fateValue; //缘分值

}
```

3.3.3.2、TodayBestController

```
package com.tanhua.server.controller;

import com.tanhua.server.service.TodayBestService;
import com.tanhua.server.vo.TodayBest;
import lombok.extern.slf4j.Slf4j;
import org.springframework.beans.factory.annotation.Autowired;
import org.springframework.http.HttpStatus;
import org.springframework.http.ResponseEntity;
import org.springframework.web.bind.annotation.GetMapping;
import org.springframework.web.bind.annotation.RequestHeader;
import org.springframework.web.bind.annotation.RequestMapping;
import org.springframework.web.bind.annotation.RestController;

@RestController
@RequestMapping("tanhua")
@Slf4j
public class TodayBestController {

    @Autowired
    private TodayBestService todayBestService;

    /**
     * 查询今日佳人
     *
     * @param token
     * @return
     */
    @GetMapping("todayBest")
    public ResponseEntity<TodayBest>
    queryTodayBest(@RequestHeader("Authorization") String token) {
        try {
            TodayBest todayBest = this.todayBestService.queryTodayBest(token);
            if (null != todayBest) {
                return ResponseEntity.ok(todayBest);
            }
        } catch (Exception e) {
            log.error("查询今日佳人出错~ token = " + token, e);
        }
        return
    ResponseEntity.status(HttpStatus.INTERNAL_SERVER_ERROR).body(null);
    }
}
```

3.3.3.3、TodayBestService

```
package com.tanhua.server.service;

import com.tanhua.server.pojo.User;
import com.tanhua.server.pojo.UserInfo;
import com.tanhua.server.vo.TodayBest;
import org.apache.commons.lang3.StringUtils;
import org.springframework.beans.factory.annotation.Autowired;
import org.springframework.beans.factory.annotation.Value;
import org.springframework.stereotype.Service;

@Service
public class TodayBestService {

    @Autowired
    private UserService userService;

    @Autowired
    private RecommendUserService recommendUserService;

    @Autowired
    private UserInfoService userInfoService;

    @Value("${tanhua.sso.default.user}")
    private Long defaultUser;

    public TodayBest queryTodayBest(String token) {
        //校验token是否有效，通过sso的接口进行校验
        User user = this.userService.queryUserByToken(token);
        if (null == user) {
            //token非法或已经过期
            return null;
        }

        //查询推荐用户（今日佳人）
        TodayBest todayBest =
this.recommendUserService.queryTodayBest(user.getId());
        if(null == todayBest) {
            //给出默认的推荐用户
            todayBest = new TodayBest();
            todayBest.setId(defaultUser);
            todayBest.setFateValue(80L); //固定值
        }

        //补全个人信息
        UserInfo userInfo =
this.userInfoService.queryUserInfoById(todayBest.getId());
        if(null == userInfo) {
```

```

        return null;
    }

    todayBest.setAvatar(userInfo.getLogo());
    todayBest.setNickname(userInfo.getNickName());
    todayBest.setTags(StringUtils.split(userInfo.getTags(), ' ', ''));
    todayBest.setGender(userInfo.getSex().getValue() == 1 ? "man" :
"woman");
    todayBest.setAge(userInfo.getAge());

    return todayBest;
}

}

```

3.3.3.4、UserService

```

package com.tanhua.server.service;

import com.fasterxml.jackson.databind.ObjectMapper;
import com.tanhua.server.pojo.User;
import lombok.extern.slf4j.Slf4j;
import org.apache.commons.lang3.StringUtils;
import org.springframework.beans.factory.annotation.Autowired;
import org.springframework.beans.factory.annotation.Value;
import org.springframework.stereotype.Service;
import org.springframework.web.client.RestTemplate;

@Service
@Slf4j
public class UserService {

    @Autowired
    private RestTemplate restTemplate;

    @Value("${tanhua.sso.url}")
    private String ssoUrl;

    private static final ObjectMapper MAPPER = new ObjectMapper();

    /**
     * 通过sso的rest接口查询
     *
     * @param token
     * @return
     */
    public User queryUserByToken(String token) {
        String url = ssoUrl + "/user/" + token;
        try {
            String data = this.restTemplate.getForObject(url, String.class);

```

```
        if (StringUtils.isEmpty(data)) {
            return null;
        }
        return MAPPER.readValue(data, User.class);
    } catch (Exception e) {
        log.error("校验token出错, token = " + token, e);
    }
    return null;
}
}
```

```
package com.tanhua.server.config;

import org.springframework.context.annotation.Bean;
import org.springframework.context.annotation.Configuration;
import org.springframework.http.client.ClientHttpRequestFactory;
import org.springframework.http.client.SimpleClientHttpRequestFactory;
import org.springframework.http.converter.StringHttpMessageConverter;
import org.springframework.web.client.RestTemplate;

import java.nio.charset.Charset;

@Configuration
public class RestTemplateConfig {

    @Bean
    public RestTemplate restTemplate(ClientHttpRequestFactory factory) {
        RestTemplate restTemplate = new RestTemplate(factory);
        // 支持中文编码
        restTemplate.getMessageConverters().set(1, new
StringHttpMessageConverter(Charset.forName("UTF-8")));
        return restTemplate;
    }

    @Bean
    public ClientHttpRequestFactory simpleClientHttpRequestFactory() {
        SimpleClientHttpRequestFactory factory = new
SimpleClientHttpRequestFactory();
        factory.setReadTimeout(5000); //单位为ms
        factory.setConnectTimeout(5000); //单位为ms
        return factory;
    }
}
```

3.3.3.5、RecommendUserService

```
package com.tanhua.server.service;

import com.alibaba.dubbo.config.annotation.Reference;
import com.tanhua.dubbo.server.api.RecommendUserApi;
import com.tanhua.dubbo.server.pojo.RecommendUser;
import com.tanhua.server.vo.TodayBest;
import org.springframework.stereotype.Service;

/**
 * 负责与dubbo服务进行交互
 */
@Service
public class RecommendUserService {

    @Reference(version = "1.0.0")
    private RecommendUserApi recommendUserApi;

    public TodayBest queryTodayBest(Long userId) {
        RecommendUser recommendUser =
this.recommendUserApi.queryWithMaxScore(userId);
        if(null == recommendUser) {
            return null;
        }

        TodayBest todayBest = new TodayBest();
        todayBest.setId(recommendUser.getUserId());

        //缘分值
        double score = Math.floor(recommendUser.getScore()); //取整,98.2 -> 98
        todayBest.setFateValue(Double.valueOf(score).longValue());

        return todayBest;
    }
}
```

3.3.3.6、UserInfoService

```
package com.tanhua.server.service;

import com.baomidou.mybatisplus.core.conditions.query.QueryWrapper;
import com.tanhua.server.mapper.UserInfoMapper;
import com.tanhua.server.pojo.UserInfo;
import org.springframework.beans.factory.annotation.Autowired;
import org.springframework.stereotype.Service;
```

```

@Service
public class UserInfoService {

    @Autowired
    private UserInfoMapper userInfoMapper;

    public UserInfo queryUserInfoByUserId(Long userId) {
        QueryWrapper<UserInfo> queryWrapper = new QueryWrapper<>();
        queryWrapper.eq("user_id", userId);
        return this.userInfoMapper.selectOne(queryWrapper);
    }
}

```

3.3.3.7、UserInfoMapper

```

package com.tanhua.server.mapper;

import com.baomidou.mybatisplus.core.mapper.BaseMapper;
import com.tanhua.common.pojo.UserInfo;

public interface UserInfoMapper extends BaseMapper<UserInfo> {
}

```

3.3.4、测试

单元测试，测试dubbo服务：

```

package com.tanhua.server;

import com.tanhua.server.service.RecommendUserService;
import com.tanhua.server.vo.TodayBest;
import org.junit.Test;
import org.junit.runner.RunWith;
import org.springframework.beans.factory.annotation.Autowired;
import org.springframework.boot.test.context.SpringBootTest;
import org.springframework.test.context.junit4.SpringJUnit4ClassRunner;

@SpringBootTest
@RunWith(SpringJUnit4ClassRunner.class)
public class TestRecommendUserApi {

    @Autowired
    private RecommendUserService recommendUserService;

    @Test

```

```

public void testQueryTodayBest() {
    TodayBest todayBest = this.recommendUserService.queryTodayBest(1L);
    System.out.println(todayBest);
}

}

```

整合功能测试，需要将sso、dubbo服务启动完成后进行测试。

The screenshot shows a POSTMAN request configuration and its response. The request method is GET, URL is `http://127.0.0.1/tanhua/todayBest`, and the Headers section contains `Content-Type: application/json` and `Authorization: eyJhbGciOiJIUzI1NiJ9eyJpZCI6MSwiZXhwIjoxNjA2NzY5MDQyfQ.lx64e7qeQZk2Yb08sDjuTuQ8HumPCWCUwRHmSC0OXQ`. The Response section shows a 200 status code with a warning message: "Warning: 返回参数 data.avatar 应当是预设定的枚举值之一". The Headers and Body sections show the JSON response:

```

{
  "connection": "keep-alive",
  "content-type": "application/json; charset=UTF-8",
  "date": "Mon, 30 Nov 2020 09:01:31 GMT",
  "server": "nginx/1.17.3",
  "transfer-encoding": "chunked"
}

1: [
  2:   {
  3:     "id": 95,
  4:     "avatar": "http://tanhua-dev.oss-cn-zhangjiakou.aliyuncs.com/images/logo/11.jpg",
  5:     "nickname": "heima_95",
  6:     "gender": "男",
  7:     "age": 18,
  8:     "tags": [
  9:       "单身",
  10:      "本命",
  11:      "年龄相仿"
  12:    ],
  13:    "fateValue": 100
}

```

3.3.5、解决MongoDB启动bug

在项目中，添加了mongo的依赖的话，springboot就会自动去连接本地的mongo，由于他连接不上会导致出错。

The terminal window displays a stack trace for a `MongoSocketOpenException`:

```

com.mongodb.MongoSocketOpenException: Exception opening socket
    at com.mongodb.internal.connection.SocketStream.open(SocketStream.java:67) ~[mongodriver-3.12.0.jar:na]
    at com.mongodb.internal.connection.InternalStreamConnection.open(InternalStreamConnection.java:61) ~[mongodriver-3.12.0.jar:na]
    at com.mongodb.internal.connection.DefaultServerMonitor$ServerMonitorRunnable.run(DefaultServerMonitor.java:114) ~[mongodriver-3.12.0.jar:na]
    at java.lang.Thread.run(Thread.java:748) [na:1.8.0_144]
Caused by: java.net.ConnectException: Connection refused: connect
    at java.net.DualStackPlainSocketImpl.waitForConnect(Native Method) ~[na:1.8.0_144]
    at java.net.DualStackPlainSocketImpl.socketConnect(DualStackPlainSocketImpl.java:85) ~[na:1.8.0_144]
    at java.net.AbstractPlainSocketImpl.doConnect(AbstractPlainSocketImpl.java:350) ~[na:1.8.0_144]
    at java.net.AbstractPlainSocketImpl.connect(AbstractPlainSocketImpl.java:188) ~[na:1.8.0_144]
    at java.net.PlainSocketImpl.connect(PlainSocketImpl.java:172) ~[na:1.8.0_144]
    at java.net.SocksSocketImpl.connect(SocksSocketImpl.java:392) ~[na:1.8.0_144]
    at java.net.Socket.connect(Socket.java:589) ~[na:1.8.0_144]

```

解决：

springboot中添加排除自动配置的注解

```

package com.tanhua.server;

import org.mybatis.spring.annotation.MapperScan;

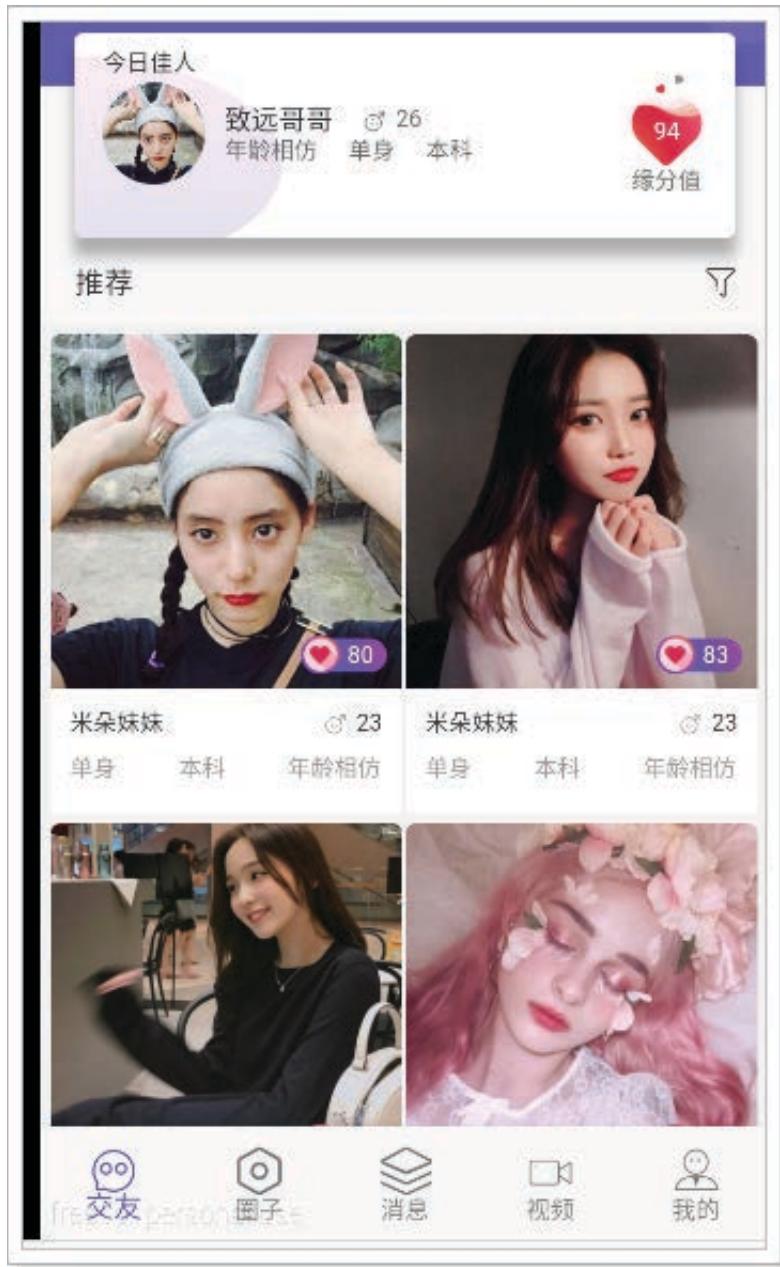

```

```
import org.springframework.boot.SpringApplication;
import org.springframework.boot.autoconfigure.SpringBootApplication;
import org.springframework.boot.autoconfigure.data.mongo.MongoDataAutoConfiguration;
import org.springframework.boot.autoconfigure.mongo.MongoAutoConfiguration;

@MapperScan("com.tanhua.server.mapper") //设置mapper接口的扫描包
@SpringBootApplication(exclude = {MongoAutoConfiguration.class,
MongoDataAutoConfiguration.class}) //排除mongo的自动配置
public class ServerApplication {

    public static void main(String[] args) {
        SpringApplication.run(ServerApplication.class, args);
    }
}
```

4、推荐列表

4.1、mock接口

地址：<https://mock-java.itheima.net/project/35/interface/api/623>

基本信息

接口名称：	推荐朋友	创建人：	admin
状态：	● 已完成	更新时间：	2020-10-16 09:24:28
接口路径：	GET /tanhua/recommendation		
Mock地址：	https://mock-java.itheima.net/mock/35/tanhua/recommendation		

请求参数

Headers :

参数名称	参数值	是否必须	示例	备注
Content-Type	application/json	是		
Authorization	eyJ0eXAiOiJKV1QiLCJhbGciOiJIUzI1NiJ9.eyJleHAiOjE1NjI4MjkzMzYsInVzZXJfaWQiOiIxln0.Mbzn6LzsLrkvWEbhexR3ITYDZjxqlcqW11rJxDQ6Ewk	是		令牌

Query :

参数名称	是否必须	示例	备注
page	是	1	当前页数
pagesize	是	10	页尺寸
gender	是	man	性别 man woman
lastLogin	是	1天	近期登陆时间
age	是	20岁	年龄
city	是	昌平区	居住地
education	是	本科	学历

4.2、查询参数对象

```
package com.tanhua.server.vo;

import lombok.AllArgsConstructor;
import lombok.Data;
import lombok.NoArgsConstructor;

@Data
@NoArgsConstructor
@AllArgsConstructor
public class RecommendUserQueryParam {

    private Integer page = 1; //当前页数
    private Integer pagesize = 10; //页尺寸
    private String gender; //性别 man woman
    private String lastLogin; //近期登陆时间
    private Integer age; //年龄
    private String city; //居住地
    private String education; //学历
}
```

4.3、结果对象

```
package com.tanhua.server.vo;

import lombok.AllArgsConstructor;
import lombok.Data;
import lombok.NoArgsConstructor;

import java.util.Collections;
import java.util.List;

@Data
@AllArgsConstructor
@NoArgsConstructor
public class PageResult {

    private Integer counts = 0; //总记录数
    private Integer pagesize = 0; //页大小
    private Integer pages = 0; //总页数
    private Integer page = 0; //当前页码
    private List<?> items = Collections.emptyList(); //列表

}
```

4.4、Controller

```
/**
 * 查询推荐用户列表
 *
 * @param token
 * @param queryParam
 * @return
 */
@GetMapping("recommendation")
public ResponseEntity<PageResult>
queryRecommendation(@RequestHeader("Authorization") String token,
                    RecommendUserQueryParam queryParam) {
    try {
        PageResult pageResult =
this.todayBestService.queryRecommendation(token, queryParam);
        if (null != pageResult) {
            return ResponseEntity.ok(pageResult);
        }
    } catch (Exception e) {
        log.error("查询推荐用户列表出错~ token = " + token, e);
    }
}
```
