

Rulers are usually separated into eighths of an inch.

The smallest mark represents  $\frac{1}{8}$  inch. The next larger mark represents  $\frac{1}{4}$  inch, and the next larger mark represents  $\frac{1}{2}$  inch. The longest mark on a ruler represents an inch.

**EXAMPLE** Draw a Line Segment

- 1 Draw a line segment measuring  $2\frac{3}{8}$  inches.

Draw a line segment from 0 to  $2\frac{3}{8}$ .

**Real-World EXAMPLE** Measure Length

- 2 Measure the key's length to the nearest half, fourth, or eighth inch.

The length of the key is between  $1\frac{3}{4}$  inches and  $1\frac{7}{8}$  inches. It is closer to  $1\frac{3}{4}$  inches.

The length of the key is about  $1\frac{3}{4}$  inches.

**EXAMPLE** Change Larger Units to Smaller Units

- 3  $3 \text{ ft} =$     in.

Since 1 foot = 12 inches, multiply 3 by 12.

$$3 \times 12 = 36$$

So, 3 feet = 36 inches.

## Remember

When changing from larger units to smaller units, the number of units will be greater. When changing from smaller units to larger units, the number of units will be fewer.

To change from larger units to smaller units you multiply. Similarly, to change from smaller units to larger units you divide.

### EXAMPLE

### Change Smaller Units to Larger Units

4  $21 \text{ ft} = \quad \text{yd}$

Since 3 feet = 1 yard, divide 21 by 3.

$$21 \div 3 = 7$$

So, 21 feet = 7 yards.

### Real-World EXAMPLE

5 A bookcase is 60 inches tall. The distance between the top of the bookcase and the ceiling is 4 feet. What is the distance in feet between the floor and the ceiling?

First, find the height of the bookcase in feet.

$$60 \div 12 = 5 \quad \text{Since 12 inches} = 1 \text{ foot, divide 60 by 12.}$$

Since the bookcase is 5 feet tall and the distance between the top of the bookcase and the ceiling is 4 feet, then the distance between the floor and the ceiling is 5 feet + 4 feet or 9 feet.

## CHECK What You Know

Draw a line segment of each length. See Example 1 (p. 633)

1.  $1\frac{1}{4}$  in.

2.  $\frac{5}{8}$  in.

Measure the length of each line segment or object to the nearest half, fourth, or eighth inch. See Example 2 (p. 633)

Complete. See Examples 3, 4 (pp. 633–634)

5.  $4 \text{ yd} = \quad \text{ft}$

6.  $4 \text{ mi} = \quad \text{yd}$

7.  $72 \text{ in.} = \quad \text{yd}$

8.  $5,280 \text{ ft} = \quad \text{mi}$

9. Brianna's brother is about 25 inches shorter than she is. If Brianna is 5 feet tall, about how tall is her brother in feet? See Example 5 (p. 634)

10.  Describe how you would change 12 feet to yards.

## Practice and Problem Solving

Draw a line segment of each length. See Example 1 (p. 633)

11.  $2\frac{1}{2}$  in.

12.  $3\frac{1}{4}$  in.

13.  $\frac{3}{4}$  in.

14.  $1\frac{3}{8}$  in.

Measure the length of each line segment or object to the nearest half, fourth, or eighth inch. See Example 2 (p. 633)

Complete. See Examples 3, 4 (pp. 633–634)

21. 5 yd = in.

22. 6 yd = ft

23.  $6\frac{1}{2}$  ft = in.

24. 3.5 mi = ft

25. 48 in. = ft

26. 10 ft = yd

27. 6,160 yd = mi

28. 510 in. = ft

29. The largest telescope in the world is powerful enough to identify a penny that is 5 miles away. How many yards is this?

30. Top Thrill Dragster at Cedar Point in Sandusky, Ohio, is the tallest roller coaster in the United States. It has a height of 420 feet. What is this height in yards?

### H.O.T. Problems

31. **OPEN ENDED** Draw a segment that measures between  $1\frac{1}{2}$  inches and  $2\frac{1}{4}$  inches long. State the measure of the segment to the nearest fourth inch. Then state the measure to the nearest eighth inch.

32. **CHALLENGE** How many sixteenths of an inch are in a foot? How many half inches are in a yard?

**REASONING** Determine whether you would measure each length or distance in inches, feet, yards, or miles. Explain your reasoning.

33. length of a computer monitor

34. distance from your home to school

35. **WRITING IN MATH** Suppose your friend says that 24 feet is equal to 2 inches. Is this reasonable? Explain.

# Capacity and Weight in the Customary System

## GET READY to Learn

### Hands-On Mini Lab

Several different milk containers are shown at the right.

### MAIN IDEA

I will change units of capacity and weight in the customary system.

### Preparation for Standard 6AF2.1

Convert one unit of measurement to another (e.g., from feet to miles, from centimeters to inches).

### New Vocabulary

capacity

fluid ounce

cup

pint

quart

gallon

ounce

pound

ton

Step 1 Fill the pint container with water. Then pour the water into the quart container. Repeat until the quart container is full. Record the number of pints needed to fill the quart.

Step 2 Fill the quart container with water. Then pour the water into the gallon container. Repeat until the gallon container is full. Record the number of quarts needed to fill the gallon.

Complete.

- 1 quart =      pints
- 2 quarts =      pints
- 1 gallon =      quarts
- 1 gallon =      pints
- What fractional part of 1 gallon would fit in 1 pint?
- How many gallons are equal to 12 quarts? Explain.

**Capacity** refers to the amount that can be held in a container. The most commonly used customary units of capacity are shown.

Unit	Model
1 <b>fluid ounce</b> (fl oz)	2 tablespoons of water
1 <b>cup</b> (c) = 8 fl oz	coffee cup
1 <b>pint</b> (pt) = 2 c	small ice cream container
1 <b>quart</b> (qt) = 2 pt	large liquid measuring cup
1 <b>gallon</b> (gal) = 4 qt	large plastic jug of milk

As with units of length, to change from larger units to smaller units, multiply. To change from smaller units to larger units, divide.

## EXAMPLES

### Change Units of Capacity

#### Vocabulary Link

##### Capacity

Everyday Use the maximum amount that can be contained, as in a theater filled to capacity

Math Use amount that can be held in a container

Complete.

1  $3 \text{ qt} = \quad \text{pt}$

You know that there are 2 pints in 1 quart.

Since you are changing a larger unit to a smaller unit, multiply 3 by 2.

$$3 \times 2 = 6$$

So, 3 quarts = 6 pints.

2  $64 \text{ fl oz} = \quad \text{pt}$

First, find the number of cups in 64 fluid ounces.

Since 8 fluid ounces = 1 cup, divide 64 by 8.

$$64 \div 8 = 8$$

So, 64 fluid ounces = 8 cups. Next, find the number of pints in 8 cups.

Since 2 cups = 1 pint, divide 8 by 2.

$$8 \div 2 = 4$$

So, 64 fluid ounces = 4 pints.

#### Remember

For Example 2,  
8 fluid ounces  
1 cup and 2 cups  
1 pint, you need  
**divide**  
**twice**.  
 $8 \div 8 = 8$   
and  
So, 64 fluid  
ounces  
= 4 pints.

Personal Tutor at \_\_\_\_\_

The most commonly used customary units of weight are shown.

Unit	Model
1 ounce (oz)	pencil
1 pound (lb) = 16 oz	package of notebook paper
1 ton (T) = 2,000 lb	small passenger car
