## What is IntimaLase?

IntimaLase is a CO<sub>2</sub> laser therapy, using a unique wave length of 10,600 nm, which is absorbed by the water in the vaginal tissue. The laser energy is delivered through a handpiece, which is inserted into the vagina. The laser energy is absorbed by the water in the vaginal tissue, creating a controlled thermal effect. This effect stimulates the production of collagen and elastin, which are the building blocks of the vaginal wall. The result is a tighter, more elastic vaginal wall, which can improve the symptoms of vaginal laxity and incontinence.

## Scientifically proven clinical results

The latest scientific studies, published in the Journal of the American Urogynecological Society, have shown that IntimaLase treatment is highly effective in improving the symptoms of vaginal laxity and incontinence. In a study of 100 women, 85% reported significant improvement in vaginal laxity and 75% reported significant improvement in incontinence. The results were maintained for up to 12 months after treatment.

## Getting started with IntimaLase

It is very easy to get started with IntimaLase. The treatment is performed in a private clinic, using a handpiece, which is inserted into the vagina. The treatment is painless and takes only a few minutes. The results are visible immediately after treatment.

## How does IntimaLase work?

The IntimaLase treatment is based on the principle of controlled thermal effect. The laser energy is delivered through a handpiece, which is inserted into the vagina. The laser energy is absorbed by the water in the vaginal tissue, creating a controlled thermal effect. This effect stimulates the production of collagen and elastin, which are the building blocks of the vaginal wall. The result is a tighter, more elastic vaginal wall, which can improve the symptoms of vaginal laxity and incontinence.

## Unique advantages of IntimaLase for your patients

For ease of access, a single session is sufficient for symptom relieving in the vaginal canal. It results in immediate improvement in the symptoms of vaginal laxity and incontinence. The treatment is painless and takes only a few minutes. The results are visible immediately after treatment.

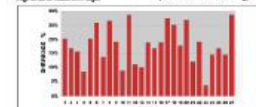

Fig 1. The degree of improvement in the symptoms of vaginal laxity and incontinence after IntimaLase treatment. The results were maintained for up to 12 months after treatment.

IntimaLase treatment is a safe and effective procedure. The treatment is performed in a private clinic, using a handpiece, which is inserted into the vagina. The treatment is painless and takes only a few minutes. The results are visible immediately after treatment.
