汕头中考英语模拟试题题库含答案

一、语法选择

通读下面短文，按照句子结构的语法性和上下文连贯的要求，从各题所给的四个选项中选出一个最佳选项。

Last year, a group of elephants made a decision: go north! After months of travelling, they made it 500 kilometers away___1.____their home in Xishuangbanna, Yunnan.

It's not common to see Asian elephants travel such___2.____long way. Scientists are not sure why___3.____this. Some believe it's because they were looking for better food. According to Zhao Huaidong from the International Fund for Animal Welfare, the number of Asian elephants___4.____now because of human protection efforts. So their old homes might not have enough food for___5.____. At the same time, elephants are quite___6.____in the vegetables and fruit that people grow.

Another possibility, according to Chen, is that they have lost their way. Some___7.____also believe that they were traveling because of migratory instinct (迁徙本能). Recent solar (太阳的) activity has changed earth's magnetic field (磁场). This might make the elephants think that they should migrate.

During their long journey, the 15 elephants have already damaged (破坏) 561,333 square meters of farmland,___8.____we need to protect them. For the safety of both humans and the elephants, people fed them tons of food___9.____them away from towns and cities. Seventy-six police cars and trucks___10.____to keep an eye on the elephants.

Luckily, on August 8th, *Xinhua News* said that the elephants have come back to the living place where they used to live.

As COVID-19 is still spreading in many countries, quickly finding people who have the virus is very important. But COVID-19 is not easy to detect. Many people who catch the virus clearly show signs of being ill, like having a fever or coughing. But many others show no signs at all. These people are "asymptomatic" and they can still pass the virus to others.

Now, scientists from Massachusetts Institute of Technology, a famous American college, have developed a method which can quickly detect whether a person has COVID-19 or not just from the way he or she coughs or speaks. The scientists turned to an AI method known as "deep learning".

In deep learning, computer programs collected a lot of information, analyzed（分析）it and built certain models. The information here was tens of thousands of recordings of coughing and speaking from people who had caught the virus. When the scientists tested their AI models, they found that <u>they</u> could detect 98.5% of the people who caught the virus, including 100% of the asymptomatic people.

Brian Subirana, one of the scientists, says, "We think this shows that the way one person produces sound changes when he or she has COVID-19, even if he or she is asymptomatic." The scientists now want to turn their models into an app that can run on mobile phones. If they are able to do that, it could allow people to quickly and easily check whether they have caught the virus.

26．From the passage, who are asymptomatic people?

A．Those who do not cough at all although they catch the virus

B．Those who have a high fever when they catch the virus.

C．Those who catch the virus but don't show any signs of being ill.

D．Those who catch the virus but won't pass it to any other one.

27．How does the new method work?

A．By analyzing a person's voice.

B．By taking a person's temperature.

C．By taking a person to the hospital.

D．By asking a person some questions.

28．What does the underlined word "they" refer to?

A．the viruses　　B．the scientists

C．the AI models　　D．the asymptomatic people

29．Where will the AI models be used according to Brian?

A．Everywhere.　　B．On computers.

C．In hospitals.　　D．On mobile phones.

30．What can you read from the passage?

A．An AI method can help detect the COVID-19 patients accurately.

B．An AI method can help find where the COVID came from.

C．COVID-19 is too easy to detect with the help of an AI robot.

D．COVID-19 can't be detected even with the help of an AI robot.
