B. The Noah is designed to house up to 40,000 people.
C. It's not convenient to take a bus near the apartment.
D. If you want to repair your car, you can call 719-5638.

Stars produce energy every second. When a star fails to make enough energy, its center collapses. If the star is big enough, it will form a black hole. If no, it will become a smaller and heavier star. During their lives, black holes will "eat" anything that comes close, causing them to grow bigger and bigger. Smaller black holes can move around space at the speed of 400,000 kilometers per hour. But the bigger black holes that are found in the center of galaxies usually don't move. Besides, black holes don't last forever. According to Stephen Hawking, black holes will get smaller over time if they don't "eat" enough. But we've never actually seen this happen.

Black holes are among the most exciting mysteries in the universe. They have drawn even more attention since the first photo of a black hole came out on April 10, 2019. Black holes are objects in space with extremely strong gravity. They take in everything around them—even light. They are made up of three parts: the accretion disk, the event horizon, and the singularity (奇点). The accretion disk is the outer ring of a black hole. If matter enters this area, it will move around the black hole before being taken in. The event horizon is the side of a black hole. Nothing can run away after being taken into the event horizon. This is
